SALESFORCE PROCESS MAPPING AND DOCUMENTATION

Week 1 Project Report | Process Audit Simulation

Prepared as a learning simulation using standard Salesforce CRM concepts

Executive Summary

This report maps three business-critical CRM processes commonly supported by Salesforce: lead management, opportunity tracking, and customer case resolution. It documents representative workflows, identifies likely friction points, and recommends practical improvements. This is a training simulation; no client Salesforce org or operational dataset was accessed.

Objectives and Scope

Map inputs, activities, decisions, outputs and exception paths; assess operational inefficiencies; recommend configuration, automation, reporting and governance improvements; define KPIs and a rollout approach.

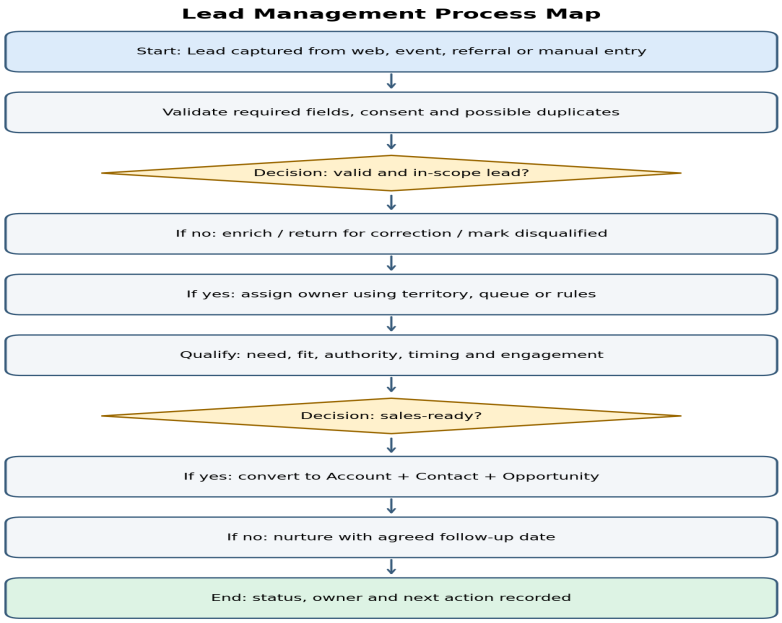

Process	Scope
Lead management	Capture, validate, assign, qualify, convert or nurture/disqualify leads
Opportunity tracking	Qualify, progress stages, approve commercial exceptions, close and hand off
Case resolution	Intake, classify, route, resolve/escalate, document and close cases

Method and Assumptions

The maps represent a typical baseline and must be validated with stakeholders. Actual Salesforce objects, fields, stages, queues, SLAs, approval thresholds and available features vary by organization and edition.

Process: Lead Management

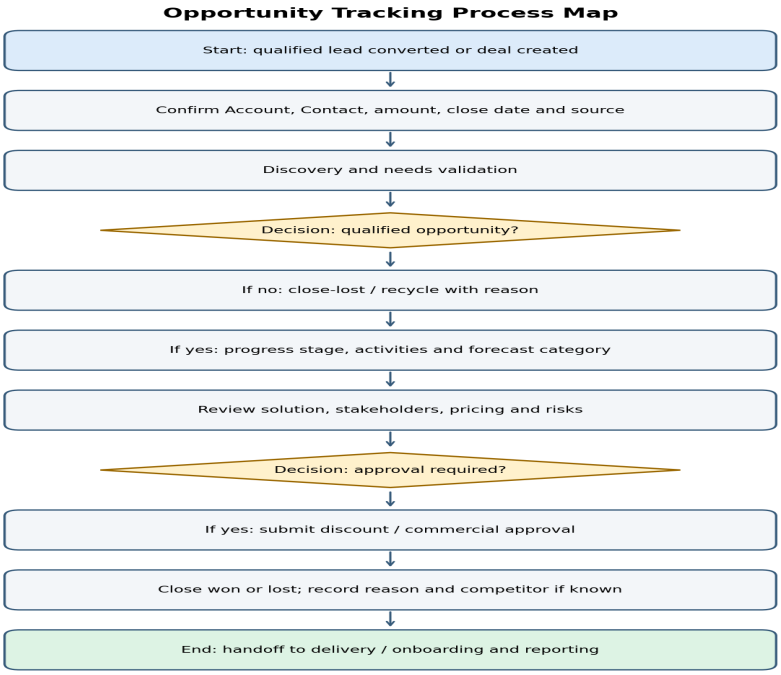

Purpose: capture prospective customers, validate data, route ownership and qualify sales readiness.

Inputs	Outputs	Optimization focus
Forms, imports, referrals, contact details, consent and source	Assigned lead; converted Account/Contact/Opportunity; nurture or disqualification	Duplicate rules, required fields, assignment rules, qualification checklist, next-step reminders

Process: Opportunity Tracking

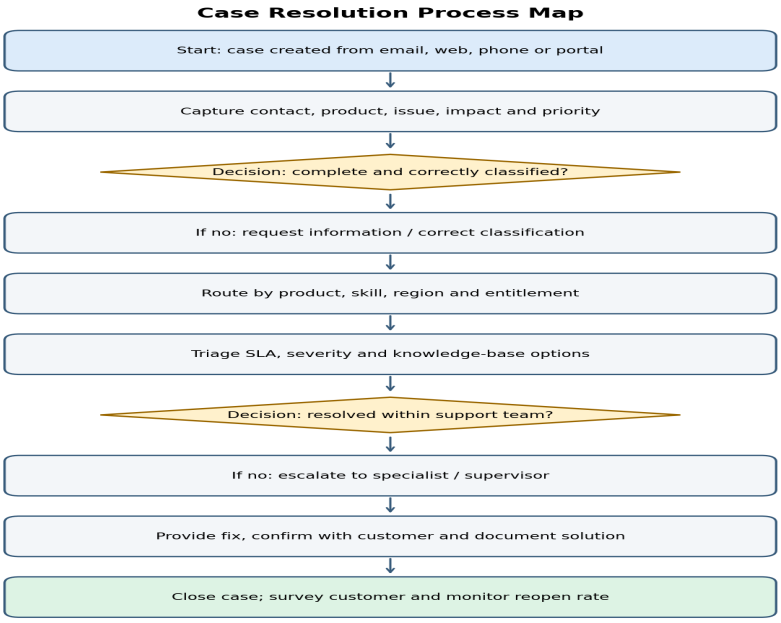

Purpose: manage a potential sale from qualification through discovery, approval, close and handoff.

Inputs	Outputs	Optimization focus
Account/contact, value, close date, need and activity history	Stage/forecast update; closed-won handoff or closed-lost reason	Stage exit criteria, approval automation, close-date change monitoring, stale-deal alerts

Process: Case Resolution

Purpose: receive customer issues, classify urgency, resolve or escalate, and capture closure outcomes.

Inputs	Outputs	Optimization focus
Email/web/phone/portal, customer, issue, impact and product	Resolved case, escalation trail, feedback and knowledge candidate	Guided intake, skill-based routing, SLA alerts, resolution notes and knowledge reuse

Cross-Process Findings

Theme	Recommendation
Data quality	Validation, duplicate handling, controlled picklists, field ownership and data-quality reviews
Ownership	Fallback queues, assignment logic, aging alerts and reassignment procedures
Automation	Automate repeatable tasks first; document errors, owners and exception paths
Reporting	Shared metric dictionary, dashboards and report access standards
Governance	Sandbox testing, approvals, release notes, regression tests and rollback plans
Adoption	User co-design, role-based training, job aids and adoption monitoring

Prioritized Roadmap

Phase	Illustrative timing	Actions / exit criteria
Discover and baseline	Week 1	Validate maps and KPIs; approve current state
Quick wins	Weeks 2–3	Critical field/duplicate controls, ownership fallbacks and alerts; test and train
Workflow improvements	Weeks 4–6	Stage guidance, approval automation, case routing and SLA escalation; UAT sign-off
Pilot and refine	Weeks 7–8	Pilot, resolve defects and assess adoption
Govern and optimize	Ongoing	Monthly KPI review and quarterly process audit

KPIs

Process	KPI examples
Lead	Median time to first response; lead-to-opportunity conversion; duplicate rate
Opportunity	Stage conversion; forecast accuracy; stale opportunity rate; close-date changes
Case	First response time; first-contact resolution; SLA attainment; reopen rate

Set targets only after collecting a reliable baseline and agreeing on definitions, exclusions, time zones and cohort rules.

Risk and Control Register

Risk	Mitigation	Owner
Bad data or duplicate records	Validation, matching rules and steward review	Admin + process owner

Risk	Mitigation	Owner
Automation failure or misrouting	Sandbox testing, error notifications and fallback queues	Salesforce admin
Unauthorized access	Least privilege, field-level security and access reviews	Platform/security owner
Unapproved commercial terms	Approval thresholds and audit trail	Sales leadership/Finance
SLA breach	Milestone alerts, escalation paths and exception reports	Support manager
Low adoption	User testing, training and adoption metrics	Change lead/managers

Testing, Governance and Conclusion

Test normal and exception paths including missing data, duplicates, reassignment, rejected approvals, escalations, reopened cases and automation errors. Use a sandbox, document test results, train users and maintain a field dictionary, automation inventory and rollback plan.

The strongest opportunities in this simulated baseline are data quality, clear ownership, consistent decision criteria and timely follow-up/escalation. Validate the maps with real stakeholders before implementation.

Workshop Questions and Reference Frameworks

Confirm channels, owners, minimum fields, stage definitions, SLAs, approval thresholds, trusted reports and privacy/retention requirements. For implementation, consult current official Salesforce Help documentation on Leads and Lead Conversion, Opportunities, Case Management, Assignment Rules, Duplicate Management, Flow, Approval Processes, Reports and Dashboards, and Entitlement/Milestone Management.
